

## Software Versions

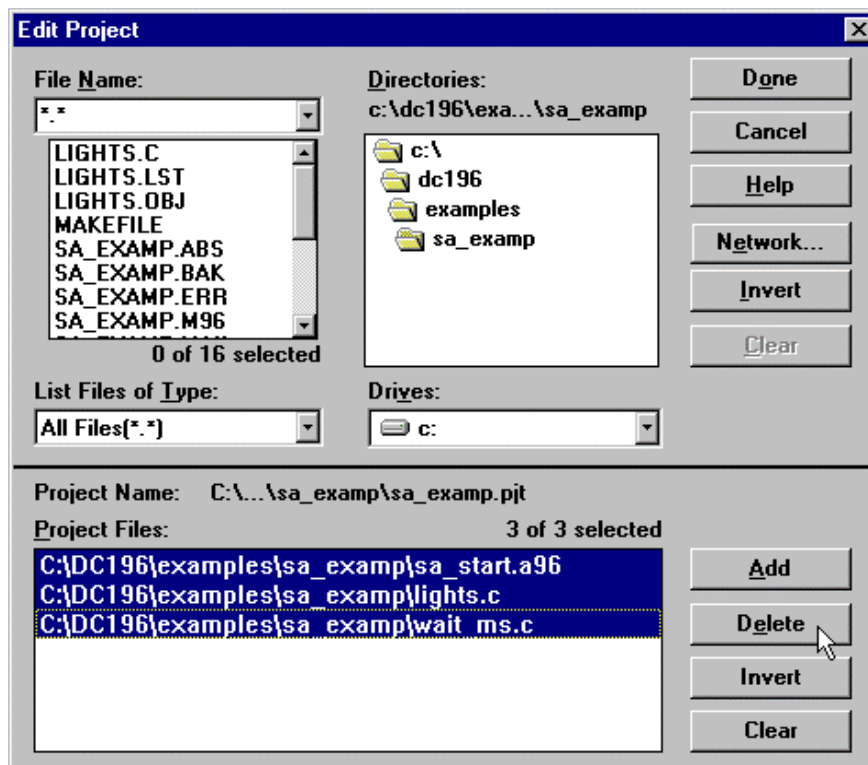

The TASKING evaluation (DEMO) software v5.0 r4 for the 196/296 contains a problem as described below.

## Problem Description

Due to the restricted command line length of Windows NT 3.51, it is not possible to rebuild the SA example using the default installation of the 196/296 evaluation software. Other PC operating systems (Windows 3.1x, Windows 95 and Windows NT 4.0) do not suffer from this deficiency.

## Workaround

In order to work around this problem, you have to copy all the example files to another (new shortname) directory (e.g. from "\\DC196\EXAMPLES\SA\_EXAMP\\*.\*" to "\\SA") and open the SA\SA\_EXAMP.PJT project file. You now have to reconfigure the project (Project|Edit... menu) by deleting the files from \DC196\EXAMPLES\SA\_EXAMP (as shown in the figure below)

and adding the same files from \SA to the project. Now you can Build the application as described in the Quick Start tutorial. Please note that Figure 5 of the Quick Start guide is for illustrative purposes only, since all the C compiler options are already set to the correct values by default (i.e. OMF96 version 3.2).
