Manual Purpose and Structure

Manual Purpose

You should read this manual if you:

• install a licensed TASKING product and need more information about licensing and installation than what is described in the Getting Started manual of the TASKING product

• are upgrading or otherwise modifying existing licenses

• install a local TASKING license server on a network

Manual Structure

Chapter 1, Licensing Overview

Contains an overview of the terminology used in this manual and describes the different license types.

Chapter 2, Licensing TASKING Products

Explains step-by-step how to obtain and install a license for a TASKING product. Also contains a list of options and environment variables that a TASKING product uses to check for a license. Furthermore it explains the use of a license file.

Chapter 3, Local License Server

Explains how to install and configure a local license server.

Chapter 4, Administering Licenses

Explains how to monitor the status of the local license server. Also explains how to borrow, join or bulk install licenses and control access to licenses.

Related Publications

For details about installing a TASKING product, see the Getting Started manual delivered with the product.
Chapter 1. Licensing Overview

1.1. Licensing Terminology

TASKING products are protected with TASKING license management software. To use a TASKING product, you must install that product and install a license.

The following terminology is used to describe the licensing concepts and software components (in alphabetical order).

**Access file**

An access file is a file used by a local license server with rules to deny, permit, block and bind users and systems to licenses.

**Client**

A client is a TASKING product for which a license is needed. For example, a C compiler.

**Computer ID**

The computer ID is an alphanumeric value that uniquely identifies your computer. The Computer ID is required to identify the computer for a node-locked license.

**License**

A license is the right to use a product. During the execution of a TASKING product (client), the client verifies whether you have the right to use it. Therefore, the client sends the license key to the license server. If you are allowed to use the client the license server sends a license back to the client. If you use a node-locked client based license the license is not retrieved from a license server but is read from a license file stored on your computer.

**License key**

The license key is a unique key (in the format xxxx-xxxx-xxxx-xxxx) provided to you by Altium. The license key is associated with the product you ordered, it identifies that you have the right to use the product. During the installation of your product you need to enter this key.

**License server**

A license server is the process that handles the license requests from client processes. A license server can be a remote license server on the internet or a local license server on your company network.

In this manual "Local TASKING License Server" and "Local License Server" are used as synonyms. "Remote License Server" is used as a synonym for the "Remote TASKING License Server".
Security ID

The security ID is an alphanumeric value that uniquely identifies the computer that runs a local TASKING license server.

1.2. License Types

The following license types can be ordered from Altium.

Node-locked license

A node-locked license locks the software to one specific computer so you can use the product on that particular computer only.

For information about installing a node-locked license see Section 2.3.2, Installing Server Based Licenses (Floating or Node-Locked) and Section 2.3.3, Installing Client Based Licenses (Node-Locked).

Floating license

A floating license is a license located on a license server and can be used by multiple users on the network. Floating licenses allow you to share licenses among a group of users up to the number of users (seats) specified in the license.

For example, suppose 50 developers may use a client but only ten clients are running at any given time. In this scenario, you only require a ten seats floating license. When all ten licenses are in use, no other client instance can be used.

For information about installing a floating license see Section 2.3.2, Installing Server Based Licenses (Floating or Node-Locked).

License service types

The license service type specifies the process used to validate the license. The following types are possible:

- **Client based** (also known as 'standalone'). The license is serviced by the client. All information necessary to service the license is available on the computer that executes the TASKING product. This license service type is available for node-locked licenses only.
- **Server based** (also known as 'network based'). The license is serviced by a separate license server program that runs either on your companies’ network or runs in the cloud. This license service type is available for both node-locked licenses and floating licenses.

Licenses can be serviced by a cloud based license server called **Remote TASKING License Server**. This is a license server that is operated by TASKING.

Alternatively, you can install a license server program on your local network. Such a server is called a **Local TASKING License Server**. You have to configure such a license server yourself, see Section 3.2, *Installing a Local License Server*.

The benefit of using the Remote TASKING License Server is that product installation and configuration is simplified.

Unless you have an IT department that is proficient with the setup and configuration of licensing systems we recommend to use the facilities offered by the Remote TASKING License Server.
Chapter 2. Licensing TASKING Products

This chapter guides you through the process of licensing a TASKING product.

Installation advice when using a local license server

During the installation of a TASKING product you can specify to use a local license server. If you do so, the installation program asks for the server name and port number of the local license server. If you do not know this information, you can simplify the installation if you first install and run the local license server before you install the TASKING product. See Section 3.2, Installing a Local License Server.

2.1. Obtaining a License

You need a license key when you install a TASKING product on a computer. If you have not received such a license key follow the steps below to obtain one. Otherwise, you cannot install the software.

Obtaining a server based license (floating or node-locked)

• Order a TASKING product from Altium or one of its distributors.

  A license key will be sent to you by email or on paper.

If your node-locked server based license is not yet bound to a specific computer ID, the license server binds the license to the computer that first uses the license.

Obtaining a client based license (node-locked)

To use a TASKING product on one particular computer with a license file, Altium needs to know the computer ID that uniquely identifies your computer. You can do this with the getcid program that is available on the TASKING website. The detailed steps are explained below.

1. Download the getcid program from http://www.tasking.com/support/tlm/.

2. Execute the getcid program on the computer on which you want to use a TASKING product. The tool has no options. For example,

   C:\Tasking\getcid
   Computer ID: 5Dzm-L9+Z-WFbO-aMkU-5Dzm-L9+Z-WFbO-aMkU-MDAy-Y2Zm

   The computer ID is displayed on your screen.

3. Order a TASKING product from Altium or one of its distributors and supply the computer ID.

   A license key and a license file will be sent to you by email or on paper.

When you have received your TASKING product, you are now ready to install it.
2.2. Frequently Asked Questions (FAQ)

If you have questions or encounter problems you can check the support page on the TASKING website.

http://www.tasking.com/support/tlm/faq.shtml

This page contains answers to questions for the TASKING license management system TLM.

If your question is not there, please contact your nearest Altium Sales & Support Center or Value Added Reseller.

2.3. Installing a License

The license setup procedure is done by the installation program.

If the installation program can access the internet then you only need the licence key. Given the license key the installation program retrieves all required information from the remote TASKING license server. The install program sends the license key and the computer ID of the computer on which the installation program is running to the remote TASKING license server, no other data is transmitted.

If the installation program cannot access the internet the installation program asks you to enter the required information by hand. If you install a node-locked client based license you should have the license file at hand (see Section 2.1, Obtaining a License).

Floating licenses are always server based and node-locked licenses can be server based. All server based licenses are installed using the same procedure.

2.3.1. Configure the Firewall in your Network

For using the TASKING license servers the TASKING license manager tries to connect to the Remote TASKING servers lic1.tasking.com, lic2.tasking.com, lic3.tasking.com, lic4.tasking.com at the TCP ports 8080, 8936 or 80. Make sure that the firewall in your network is transparently enabled for one of these ports.

2.3.2. Installing Server Based Licenses (Floating or Node-Locked)

If you do not have received your license key, read Section 2.1, Obtaining a License before you continue.

1. If you want to use a local license server, first install and run the local license server before you continue with step 2. See Section 3.2, Installing a Local License Server.

2. Install the TASKING product and follow the instructions that appear on your screen.

The installation program asks you to enter the license information.
3. In the License key field enter the license key you have received from Altium and click Next to continue.

   *The installation program tries to retrieve the license information from a remote TASKING license server. Wait until the license information is retrieved. If the license information is retrieved successfully subsequent dialogs are already filled-in and you only have to confirm the contents of the dialogs by clicking the Next button. If the license information is not retrieved successfully you have to enter the information by hand.*

4. Select your License type and click Next to continue.

   *You can find the license type in the email or paper that contains the license key.*

5. Select Remote TASKING license server to use one of the remote TASKING license servers, or select Local TASKING license server for a local license server. The latter requires optional software.

6. (For local license server only) specify the Server name and Port number of the local license server.

7. Click Next and follow the instructions that appear on your screen to complete the installation.

### 2.3.3. Installing Client Based Licenses (Node-Locked)

If you do not have received your license key and license file, read Section 2.1, *Obtaining a License* before continuing.

1. Install the TASKING product and follow the instructions that appear on your screen.

   *The installation program asks you to enter the license information.*
2. In the License key field enter the license key you have received from Altium and click Next to continue.

The installation program tries to retrieve the license information from a remote TASKING license server. Wait until the license information is retrieved. If the license information is retrieved successfully subsequent dialogs are already filled-in and you only have to confirm the contents of the dialogs by clicking the Next button. If the license information is not retrieved successfully you have to enter the information by hand.

3. Select Node-locked client based license and click Next to continue.

4. In the License file content field enter the contents of the license file you have received from Altium.

The license data is stored in the file licfile.txt in the etc directory of the product.

5. Click Next and follow the instructions that appear on your screen to complete the installation.

2.4. License Files Created During Installation

The installation program stores the license key in the file licopt.txt in the etc directory of the product. See Section 2.4.1, Licensing Options File for details about this file. Additionally, for a node-locked client base license only, the installation program stores the license data in the file licfile.txt in the etc directory of the product. See Section 2.4.2, License File for more information.
2.4.1. Licensing Options File

All information needed by the client program to perform the license check is read from the options file `licopt.txt` or from environment variables. The options in the options file have precedence over the environment variables.

The options file `licopt.txt` is searched for according to the following search path, relative to the installation directory of the product:

Windows:

```
.;
.
.;\etc;.
.;\etc;tooldir\.\etc;tooldir\.\..\\etc;tooldir\.\..\bin;tooldir
```

UNIX:

```
.;
.
.;/etc;.
.;/etc;tooldir/./etc;tooldir/./../etc;tooldir/./../etc;
```

Alternatively, you can specify the name and location of the options file in an environment variable:

```
TSK_OPTIONS_FILE = file
```

or

```
TSK_OPTIONS_FILE_Product-Code = file
```

or

```
TSK_OPTIONS_FILE_Product-Code-version = file
```

For example:

```
TSK_OPTIONS_FILE = myoptions.txt
TSK_OPTIONS_FILE_SW160800v6_1r1 = sw160800-opt.txt
```

The following options can be present in the license options file or as an environment variable:

<table>
<thead>
<tr>
<th>Option / Environment Variable</th>
<th>Description</th>
<th>Mandatory / Optional</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>TSK_LICENSE_KEY_Product-Code</code></td>
<td>Assign the license key <code>License-key</code> to the TASKING product with product code <code>Product-Code</code>. If the string <code>PRODUCT</code> is entered instead of a license key, then the client can retrieve an arbitrary license associated with the TASKING product identified by <code>Product-Code</code> from the license server. This functionality is, for example, used for joining licenses (see Section 4.3, Joining Licenses). You can find the <code>Product-Code</code> in the email or paper that contains the license key.</td>
<td>Mandatory</td>
</tr>
<tr>
<td>Option / Environment Variable</td>
<td>Description</td>
<td>Mandatory / Optional</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>----------------------</td>
</tr>
<tr>
<td>TSK_LICENSE_SERVER = host [: port] [:]...</td>
<td>Specifies the list of license servers and associated port numbers that can be contacted by a client. A client tries to connect to a server in the order specified in the list. Only if a server is offline then a connection to another (backup) server is made. The server can be a TASKING license server or a local license server. The default is: \lic1.tasking.com:8080; lic1.tasking.com:8936; lic1.tasking.com:80; lic2.tasking.com:8080; lic2.tasking.com:8936; lic2.tasking.com:80; lic3.tasking.com:8080; lic3.tasking.com:8936; lic3.tasking.com:80; lic4.tasking.com:8080; lic4.tasking.com:8936; lic4.tasking.com:80</td>
<td>Optional</td>
</tr>
<tr>
<td>TSK_LICENSE_PORT = port</td>
<td>Connect to port \port\ on the license server. For the remote TASKING license server you can use port 8080, 8936 or port 80 (the remote TASKING license server listens on all three ports). If you use a local licenser server, specify 9090 or the port that you used during the installation of the local license server.</td>
<td>Optional</td>
</tr>
<tr>
<td>TSK_LICENSE_PROXY_SERVER = proxyserver [:port]</td>
<td>If a proxy server is required for outgoing license requests, use this option to specify \proxyserver\ as the HTTP proxy server. If you omit the \port, the default port is 3128.</td>
<td>Optional</td>
</tr>
<tr>
<td>TSK_LICENSE_PROXY_PORT = port</td>
<td>Specify the TCP port number to use for a proxy server (default: 3128).</td>
<td>Optional</td>
</tr>
<tr>
<td>TSK_LICENSE_FILE = file</td>
<td>If this option or environment variable is set, the client retrieves a license from the license file \file\ instead of a remote server. Use this option when you use a node-locked client-based license. (default: licfile.txt). The search path is the same as for the options file. Alternatively, you can specify an absolute path.</td>
<td>Optional</td>
</tr>
<tr>
<td>or TSK_LICENSE_FILE_Product-Code = file (environment variable only)</td>
<td>If you have several license files for different products you can use the product code in the environment variable name.</td>
<td>Optional</td>
</tr>
</tbody>
</table>
### Speed up network connection

If you know that only TCP port 80, the last one in the list, is open for transparent access on your firewall, you can speed up the connection process by setting the following variable in the `licopt.txt` file:

```plaintext
# Connect to port 80
TSK_LICENSE_PORT = 80
```

or a full version:

```plaintext
TSK_LICENSE_SERVER=lic1.tasking.com:80;lic3.tasking.com:80
```

### Example of an options file

```plaintext
TSK_LICENSE_KEY_SW160800 = 1283-cc0a-5e67-8ae3
TSKLICENSE_SERVER = lic1.tasking.com:8080;lic3.tasking.com:8080
TSK_LICENSE_PROXY_SERVER = proxy.mydomain.com
TSK_LICENSE_PROXY_PORT = 8081
TSK_LOG_VERBOSE
TSK_NET_TIMEOUT = 10
```

### 2.4.2. License File

If you installed a node-locked client based license, a license file has been created on your computer (`licfile.txt`). This file contains the license of your product.

Example of a license file:

```plaintext
#
# TASKING License File
#
# Issue date: 2016-05-19 15:35:43
```
# License type: Node-locked client based license|Joinable
# Suitable for the computer with computer ID: 5Dzm-L9+Z-WFbO-aMkU-5Dzm-L9+Z-WFbO-aMkU-MDAt-Y2Zm
# License key: 1283-cc0a-5e67-8ae3
# Product code: SW16080005060000

SW16080005060000=71R4BfrOqSwOUF14DTfNsrmuhHEbVNaM
07B/BrtrKkJ2KKsBYnnB2D216TlHtBB9EDGbyi0fDE2jE6RmTv

Chapter 3. Local License Server

3.1. Overview

Server based licenses can be serviced by either the remote TASKING license server or a local TASKING license server. The remote license server is accessed over the Internet whereas a local license server is accessed via your office network of your companies intranet.

A remote license server has the following advantages:

• Ease of use since you do not have to setup a local license server.

• Altium can generate a license and license key without knowing the Computer ID in advance. So, you can install the package and run it without delay, without sending the Computer ID.

• You can easily update, upgrade (e.g. from Standard to Premium Edition), add extra seats and extend your license.

• The TASKING remote license server has an uptime of 99,9%, through four servers at two different locations.

A local license server has the following advantages:

• Enables you to inspect license usage.

• Enables you to manage access to the license server and the licenses.

• Provides facilities for centralized bulk product distributions.

• Provides facilities for license management and transfer of licenses.

• Reduces internet traffic and associated delays.

The following restrictions apply to a local license server:

• By default the local license server will not execute on a virtual system. To use a local license server on a virtual system you need a special license. Also your virtual system must be configured to have a static CPU ID and a static MAC address.

• Windows7 (32/64-bit), Windows8 (64-bit) or Windows Server2008R2 (64-bit) or higher.

• Linux distributions must support GLIBC version 2.11 or higher.
**Solution 1: Local license server with internet access to remote license server**

In this situation, the local license server licenses itself against a remote TASKING license server at first startup. This requires internet access. If internet access is unavailable or not permitted, use solution 2.

**Solution 2: Local license server without internet access**

In this situation, the local license server licenses itself by reading its license data from a local key. This key must be obtained from TASKING support and added to licdopt.txt.

**Client licenses**

The local license server can retrieve licenses from a license file (licdfile.txt) or can retrieve licenses from the remote license server, or a combination of the two, depending on the chosen solution. The license file is read at startup. If the license is not available in the license file, the local license server optionally retrieves the license from the remote license server. In this case the license is not available for the client on the remote license server anymore.
Database

The local license server maintains all licenses and current license usage in a database. The licenses in the database are refreshed from the license file or from a remote server at certain intervals. When you modify the license file licdfile.txt, for example, to add a license, you do not need to restart the license server, since the license file is re-read automatically. When the local license server terminates, the current license usage is preserved in the database and is used again at startup. The database is locked to the security ID of the local license server’s hardware. Therefore, you cannot move the database to another computer.

3.2. Installing a Local License Server

Install the local license server

1. Download the TASKING License server from https://www.tasking.com/support/tlm/downloads.
2. Unpack the ZIP file and run the program setup.exe.
   
   *The TASKING Setup dialog box appears.*
3. Click on the Install button.
4. Follow the instructions that appear on your screen and Finish the installation.
5. Get the security ID of the computer on which you installed the local license server.
   
   *Open a command prompt in the bin directory of the installation directory of the TASKING license server, and enter the following command:*

   licd -I

   *For more information see Section 3.2.3, Obtaining a License for a Local License Server.*
6. Send the security ID to Altium by email: licadmin@tasking.com
7. You will receive an email in return with the license key for your local license server, attached as file licdopt.txt. Save this file into directory C:\Tasking.
8. In a second mail, you will receive the 16-character license key that is used for installing the TASKING product on your clients (see Section 2.3, Installing a License). If you also have received license data for the TASKING product, store it in a file. For example: licdfile.txt and put it in the directory C:\Tasking (Windows) or the directory etc under the installation directory of the local license server (UNIX).

   *On Windows, the installation program creates the directory C:\Tasking if it does not exist already.*
9. Add the following line to the options file licdopt.txt:

   LICD_LICFILE = C:\Tasking\licdfile.txt
If the file licdopt.txt does not exist, create one and put it in the same directory as you stored the license file.

You can start the local license server as a service or from the command line.

### 3.2.1. Start the Local License Server as a Service

#### Install and start the local license server as a service (Windows only)

1. Open a command prompt as Administrator and install the local license server as a service:
   
   `licd --install`

   Note that without administrator rights, you cannot install a service. Note that you cannot specify other command line options, but you can set defines in licdopt.txt. When you start the local license server as a service, this file must be present in the directory C:\Tasking. See Section 3.3, Local License Server Options and Defines for a list of defines.

2. Open a command prompt as Administrator and start the local license server as a service:
   
   `sc start "TASKING License Service"`

   Note that without administrator rights, you cannot start a service.

#### How to stop and delete the TASKING License Service (Windows only)

If you want to uninstall the local license server, you must first stop and delete the service.

- Open a command prompt as Administrator and stop and delete the local license server as a service:
  
  `sc stop "TASKING License Service"
  sc delete "TASKING License Service"

  Note that without administrator rights, you cannot stop and delete a service.

### 3.2.2. Start the Local License Server from the Command Line

The preferred way is to start the local license server as a service, but when necessary, for example for debugging purposes or on UNIX, you can start the local license server from the command line.

1. Start the local license server:
   
   `licd [option]...`

   Instead of specifying options on the command line, you can set defines in licdopt.txt. This file must be present in the current working directory or in the etc or bin directory relative to the current working directory. See Section 3.3, Local License Server Options and Defines for a list of options and defines.

2. (Optional) When you get a security alert from a firewall, allow access to the network(s) that licd needs access to.
3.2.3. Obtaining a License for a Local License Server

A local license server is licensed with the security ID of the computer on which you installed the local license server. When the local license server starts it contacts the remote license server with its security ID to get its license, or if you received a license key in licdopt.txt it verifies its security ID against this key locally.

The security ID of a local license server is unique. You can obtain the security ID with the following command:

```bash
licd -I
```

If you install a new version of the local license server, this invalidates the database. However, the security ID is still the same, so the license of the local license server is still valid. After startup the local license server validates itself at the remote license server, or with the local license key, and retrieves the client data on demand from a license file or the remote license server and builds a new database.
3.3. Local License Server Options and Defines

You can set defines in the file licdopt.txt to control the local license server. The defines in licdopt.txt are read by the local license server when installed as a service or when started from the command line. If licdopt.txt is present, this file is always read.

When you start the local license server as a service, the file licdopt.txt must be present in the following path:

    '\Tasking'

When you start the local license server from the command line, the file licdopt.txt is searched for in the following path:

Windows:

    '.;\etc;\bin'

UNIX:

    '.;/etc;/bin'

The option flags mentioned in the table below are available on the command line only. Command line options have precedence over defines from the options file. Note that you cannot use environment variables to set options for the local license server. The following options and defines are available:

<table>
<thead>
<tr>
<th>Option</th>
<th>Define in licdopt.txt</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h hostname [: port]</td>
<td>LICD_REM_SERVER = host [: port]</td>
<td>Use the remote license server for LicD validation and if requested, client licenses (default: lic3.tasking.com:8080). Possible ports you can use are 8080, 8936 or 80.</td>
</tr>
<tr>
<td>-I</td>
<td></td>
<td>Show Security ID of the computer that executes the local license server.</td>
</tr>
<tr>
<td>-l</td>
<td></td>
<td>Use the syslog (UNIX only).</td>
</tr>
<tr>
<td>-n</td>
<td></td>
<td>Run LicD, but not as a daemon (UNIX only).</td>
</tr>
<tr>
<td>-P port</td>
<td>LICD_REM_SERVER_PORT = port</td>
<td>Connect to port port on the remote license server (default: 8080). Possible ports you can use are 8080, 8936 or 80.</td>
</tr>
<tr>
<td>Option</td>
<td>Define in licdopt.txt</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>------------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>( -p \text{port} )</td>
<td>LICD_LISTEN_PORT = \text{port}</td>
<td>Listen on port \text{port} for communication with clients (default: 9090).</td>
</tr>
<tr>
<td>( -q \text{port} )</td>
<td>LICD_PROXY_PORT = \text{port}</td>
<td>Specify the TCP port number to use for a proxy server (default: 3128).</td>
</tr>
<tr>
<td>( -q \text{proxyserver}[:\text{port}] )</td>
<td>LICD_PROXY_SERVER = \text{proxyserver}[:\text{port}]</td>
<td>If a proxy server is required for outgoing license requests, use this option to specify \text{proxyserver} as the HTTP proxy server. If you omit the \text{port}, the default port is 3128.</td>
</tr>
<tr>
<td>( -R \text{num} )</td>
<td>LICD_AUTOREFRESH_TIMER = \text{num}</td>
<td>Auto-refresh timer. When the auto-refresh timer expires, the license server retrieves all licenses from either the license file (LICD_LICFILE) or from the remote license server. The number \text{num} specifies the refresh time in seconds. Valid values are between 60 and 14400 seconds (default: 600 seconds).</td>
</tr>
<tr>
<td>( -r )</td>
<td>LICD_USE_REMOTE</td>
<td>Use the remote license server to get client licenses in addition to a license file, or if no license file is present.</td>
</tr>
<tr>
<td>( -v )</td>
<td>LICD_LOG_VERBOSE</td>
<td>Verbose, repeat for more verbose.</td>
</tr>
<tr>
<td>LICD_KEY = \text{key_data}</td>
<td></td>
<td>If network connectivity is unavailable, a local license server can read its license data from a local license key. This key must be obtained from TASKING support by providing the security ID with licd -I.</td>
</tr>
<tr>
<td>LICD_MASTER = \text{host}[:\text{port}]</td>
<td></td>
<td>In a redundant master - slave configuration, use this option to specify the master server in the option file on the slave server. See Section 3.4, Redundant Master - Slave Configuration.</td>
</tr>
<tr>
<td>LICD_REFUSE_ANONYMOUS</td>
<td></td>
<td>Do not allow anonymous access to the local license server. This option forces that every client publishes his user name and system name with the client option TSK_NO_ANONYMOUS.</td>
</tr>
<tr>
<td>--install</td>
<td></td>
<td>Install the local license server as a Windows Service (Windows only).</td>
</tr>
</tbody>
</table>

Example of a local license server options file:

```
LICD\_LICFILE = licdfile.txt
LICD\_LOGFILE = mylog.log
LICD\_ACCESSFILE = myveryspecialaccess.txt
LICD\_LOG\_VERBOSE
LICD\_REM\_SERVER=lic3.tasking.com:8080
LICD\_LISTEN\_PORT = 9090
LICD\_PROXY\_SERVER = proxy.mydomain.com
LICD\_PROXY\_PORT = 8081
```
3.4. Redundant Master - Slave Configuration

In a redundant server configuration there is a master local license server and a slave local license server. In normal operation mode the master server serves the licenses for the clients and the 'Sleeping Slave' server synchronizes its own database every minute with the master database. The slave server refuses to serve licenses.

If the master becomes unreachable, the slave server changes its operation mode to 'Active Slave'. It tries to get a time limited slave license from a remote TASKING server and starts serving licenses with the last known master status. If the master server is back online again, the slave server changes its operation mode to 'Sleeping Slave' and starts the sync again with its master. The status of the slave server is not synchronized back with the master.

A slave server cannot read license files and cannot get license data from a remote TASKING server except its own slave license. It can only get data from its master.

Client configuration

To use a redundant master - slave configuration, the client options file licopt.txt must contain both servers. For example,

```
TSK_LICENSE_SERVER = master.domain.com:9090;slave.domain.com:9090
```

If the master becomes unreachable a client switches to the next server in the list, the slave. If the master comes online again the slave refuses license requests. The client switches back to the first server in the list, the master.
A redundant local license server configuration needs two local license server licenses, one for the master and one for the slave (a time limited slave license).

The master and slave license servers must have the same version number and must run on the same operating system.

**Slave server configuration**

The file `licdopt.txt` of a slave server must contain the following configuration item:

```
LICD_MASTER=hostname[:port]
```

For example:

```
LICD_MASTER=lic-master.domain.com:9090
```

### 3.5. Creating a Local License Server License File

When you receive a license that must be serviced by a local license server then the email that you receive contains a license key and the license data. You have to copy the license data to the license file (default: `licdfile.txt`).

**Example of a license email:**

Hi user,

Please find below the license for the 07-200-160-808 (TASKING VX-toolset for TriCore, Premium Edition) version 6.0.

The license key for your floating server license for 10 seats is:

```
e3e9-daef-d1c9-aa91
```

Software Product code : SW16080005060
License serial number : 12345678
Platform : Windows

Serviced by the license server with Security ID: hgt1-KvZ4-Q70W-qBoG

Below you’ll find details to get started:

**License Installation**

If you haven’t done so already, please download your TASKING toolset here.

Once downloaded, follow the steps in our License Options Page to install your software and license.

**Need Support?**
Copy the following data to your license file licdfile.txt, default in: C:\Tasking, on the system that will be running the license server –

```
SW16080005060000=4879pXXTSdt6WNMg5YDnkJvxLxFIP+Cqz
/aZB84oPlyFgJrIXymgVdlqM8odSKkFSLO4Vdu7IissrsLVJGQ
yw6qDAK3beos7kC62UCICJ1SL3oCIFw7QT7CvD7tSNnV6Wsq0
9e380BHqOhtzVNXAjkmu8R+X7qLwqhttdZ2HhpRnOtN76WY1BT2
4BcDSQoen5N+A5QmY6BrqCrbKwNJpseOGNR5MiXLe+Ijk635md
V/9L0j/vufm0Uvc9XzQfPaTpxqoOR80Vhbo06UHKQ==
```

Note that when you have multiple license key entries in licdfile.txt you must separate the keys with at least one empty line, or comment line. For example:

```
SW16080005060000=4879pXXTSdt6WNMg5YDnkJvxLxFIP+Cqz
/aZB84oPlyFgJrIXymgVdlqM8odSKkFSLO4Vdu7IissrsLVJGQ
yw6qDAK3beos7kC62UCICJ1SL3oCIFw7QT7CvD7tSNnV6Wsq0
9e380BHqOhtzVNXAjkmu8R+X7qLwqhttdZ2HhpRnOtN76WY1BT2
4BcDSQoen5N+A5QmY6BrqCrbKwNJpseOGNR5MiXLe+Ijk635md
V/9L0j/vufm0Uvc9XzQfPaTpxqoOR80Vhbo06UHKQ==
```

```
SW16080005050000=5wZBpxCWRRucQgRNipXuSdptwSPgeZxb
twndcFx558Bztq9Ct4rCo/XxqqhDr200FrZYPjeg9T2NT0xYV+

```
Chapter 4. Administering Licenses

4.1. Monitoring the Status of the Local License Server

Browser

You can inspect the actual status and see the log information of the local license server with a browser. Use the following address:

http://lic_server_hostname:9090/stats

where, lic_server_hostname is the IP address or DNS name of the local license server.

The following columns are available:

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>License key</td>
<td>The license keys of the available licenses.</td>
</tr>
<tr>
<td>Product code</td>
<td>The product code.</td>
</tr>
<tr>
<td>Serial#</td>
<td>The serial number of the product.</td>
</tr>
<tr>
<td>Valid from</td>
<td>The date at which the license becomes valid.</td>
</tr>
<tr>
<td>Expires</td>
<td>The expiration date of the license, empty for perpetual licenses.</td>
</tr>
<tr>
<td>Modified</td>
<td>The date the license was modified.</td>
</tr>
<tr>
<td>Type</td>
<td>The type of license: Float (floating license), Node (node-locked license)</td>
</tr>
<tr>
<td>Seats</td>
<td>The number of seats for a floating license.</td>
</tr>
<tr>
<td>Seats in use</td>
<td>The number of licenses currently in use.</td>
</tr>
</tbody>
</table>

If you want to log the information in a file, you can use option -L of the local license server:

licd -L licd.log

Command line

Instead of using a browser you can also use the tool licdstat to see the status and log information of a local license server.

licdstat [option]...

The following options are available:

-af file append output to a file, mutual exclusive with -f
-ft file write output to a file, mutual exclusive with -a
-h host host to query (default: localhost)
-k key query a specific key
**TASKING License Management**

- `-l` list current license status
- `-p` port TCP port to use (default: 9090)
- `-t` display server status and version
- `-u` list current users
- `-v` verbose output
- `-X` generate X-Formation compatible output

Note that the user name and system name in the users lists of a license is only available if the option `TSK_NO_ANONYMOUS` is present in `licopt.txt` on the respective client computers.

**Example:**

`licdstat -l -u -t`

**LicD:** vx.yrz localhost:9090 Thu 19 May 2016 09:24:54 CET SecurityID: 3cHE-GME0-FW3I-sHTW

```
08f3-0d7b-9fe9-25de SW16080002 v5.0 (floating ser#:99224421 seats:10 inuse:10)
  Firstname1 Lastname1/pc_a                     (v4.9  2016-05-19 09:24:11)
  Firstname2 Lastname2/pc_b                     (v5.0  2016-05-19 09:24:11)
  Firstname3 Lastname3/pc_c                     (v4.1  2016-05-19 09:24:12)
  Firstname4 Lastname4/pc_d                     (v4.6  2016-05-19 09:24:12)
  Firstname5 Lastname5/pc_e                     (v4.9  2016-05-19 09:24:13)
  Firstname6 Lastname6/pc_f                     (v4.4  2016-05-19 09:24:13)
  Firstname7 Lastname7/pc_g                     (v4.4  2016-05-19 09:24:14)
  Firstname8 Lastname8/pc_h                     (v4.4  2016-05-19 09:24:14)
  Firstname9 Lastname9/pc_i                     (v4.1  2016-05-19 09:24:15)
  Firstname10 Lastname10/pc_j                    (v5.0  2016-05-19 09:24:15)
```

```
5854-61b9-4ecb-04f0 SW16080002 v6.0 (floating ser#:99015724 seats:3 inuse:3)
  Firstname12 Lastname12/pc_b                    (v4.1  2016-05-19 09:24:16)
  Firstname13 Lastname13/pc_c                    (v6.0  2016-05-19 09:24:17)
```

You can use `licdstat` to generate output for the license statistics and management system X-Formation. The output is an XML status file which can be read by X-Formation. The following example is a Windows batch file that updates the license statistics for X-Formation:

```
:loop
  licdstat -h tlmserver.example.com -X -f c:\tlmlogs\tlm.xml
  timeout 60
  goto :loop
```

Instead of a batch file you can use the Windows Task Scheduler to call `licdstat` on a regular basis.
4.2. Transferring a License (Borrow Feature)

It is possible to move a floating license to a node-locked client based license temporarily. This is called 'borrowing'. You can use the tool licborrow to obtain a time restricted node-locked client based license on a client system from a local TASKING server servicing a floating license for that client.

The license is retrieved by specifying the product code of the TASKING product. You can find the product code in the email or paper that contains the license key. The product code consists of the letters SW and the first 6 digits of the SW code, for example SW160800.

You can restrict access to which users and systems are allowed to borrow a license. A 0 days request returns the borrowed license to the TASKING server.

**To borrow a license (Windows, GUI)**

1. From the Start menu, select Programs » TASKING VX-toolset for target vx.yrz » Borrow License. 
   
   The Borrow a License dialog appears.

2. From the Borrow license for list, select the product for which you want to borrow a license.

3. Enter the number of Days you want to borrow the license. One day literally means 24 hours.

4. Click Borrow a License.

**To borrow a license (Windows, command line)**

On Windows a command line version is available also. You can download it from https://www.tasking.com/support/tlm/downloads. Enter the following command at a Windows command prompt:

licborrowcmd [option]... product-code version

The following options are available:

- **-days**  number of days to borrow (0 .. 128), 0 returns a license
- **-L**  extended list installed products
- **-l**  list installed products
- **-v**  verbose

**Examples**

Show a list of installed products:

licborrowcmd -l

SW160800 v6.0r1 TASKING VX-toolset for TriCore
SW160800 v6.1r1 TASKING VX-toolset for TriCore
**TASKING License Management**

SW160800 v6.2r1 TASKING VX-toolset for TriCore
SW160800 v6.2r2 TASKING VX-toolset for TriCore

Borrow a license for 7 days:

licborrowcmd -d7 SW160800 v6.1r1

Return a license:

licborrowcmd -d0 SW160800 v6.1r1

Show license details about the installed products:

licborrowcmd -L

SW160800 TASKING VX-toolset for TriCore v6.0r1. License for key license-key expired on this system at 2018-09-24 17:04
SW160800 TASKING VX-toolset for TriCore v6.1r1. License for key license-key not yet borrowed
SW160800 TASKING VX-toolset for TriCore v6.2r1. License for key license-key expires on this system at 2018-10-31 15:23
SW160800 TASKING VX-toolset for TriCore v6.2r2. License for key license-key expires on this system at 2018-10-31 15:23

**To borrow a license (UNIX)**

On UNIX workstations, enter the following command at a shell command prompt, assuming that the bin directory of the TASKING product is in the search path:

licborrow [option]... product-code version

The following options are available:

- **-d** *days*  
  number of days to borrow (0 .. 128), 0 returns a license

- **-v**  
  verbose

**Example**

Borrow a license for 7 days:

licborrow -d7 SW160800 v6.1r1

Return a license:

licborrow -d0 SW160800 v6.1r1
4.3. Joining Licenses

You can bring together all licenses for one product into one overall license, this is called 'joining licenses'. Suppose you have placed two orders for a given product. In the first order you bought 5 floating licenses, in the second order you bought 10 additional floating licenses. With each order you have received a license key. You now have 15 floating licenses and 2 license keys. One key associated with 5 floating licenses, the other associated with 10 licenses.

If you run six instances of the product that use the license key obtained with the first order then one product instance will fail to execute due to the fact that there are only five licenses available. You do not want such behavior since you have bought 15 licenses. To solve this you can join licenses by updating the licopt.txt file by hand.

The following modification must be made in file licopt.txt: replace the license key by the string "PRODUCT".

For example:

# If you use a local license server you can
# implement a bulk installation by using the
# Product code as license key.
TSK_LICENSE_KEY_SW160800 = PRODUCT

When the product validates its license the license server resolves the license request by scanning through all of its licenses for the given product.

4.4. Bulk Installation

If you have to install a product on a large number of computers you may want to distribute one and the same instance of a TASKING product including the license files (licopt.txt) to all computers involved without having to execute the install program on each computer. This functionality is called "bulk installation".

To facilitate a bulk installation

1. Install a TASKING product in the regular way as described in Chapter 2, Licensing TASKING Products.

2. Join the licenses. Modify file licopt.txt as follows:

   Replace the license key by the string "PRODUCT". For example:

   # If you use a local license server you can
   # implement a bulk installation by using the
   # Product code as license key.
   TSK_LICENSE_KEY_SW160800 = PRODUCT

3. Copy the installed product tree, including file licopt.txt, to all computers.
4. On all computers where you copied licopt.txt to in step 3, set the environment variable TSK_OPTIONS_FILE_Product-Code-version to the location of licopt.txt. For example:

TSK_OPTIONS_FILE_SW160800v6_1r1 = install-dir\licopt.txt

When the product validates its license the license server resolves the license request by scanning through all of its licenses for the given product.

4.5. Restricting Access to Licenses

With an access file (default: licdaccess.txt) you can deny, permit, block and bind users and systems to licenses. Without an access file no restrictions apply, every user, system or IP address is allowed access. See option -A in Section 3.3, Local License Server Options and Defines.

By default, license requests are anonymous. To see which user name and system name are sent with a license request, you need to add the option TSK_NO_ANONYMOUS to your local licopt.txt file. See Section 2.4.1, Licensing Options File.

The commands in an access file are processed from top to bottom. A subsequent command can overrule a previous command.

After a change in the access file the license server must be restarted.

The following commands are possible in an access file.

**deny**

deny user { all | name }
deny system { all | name }
deny ip { all | ipaddr[-ipaddr] }

With this command the local license server denies access to the local license server for a user, a system, an IP address or a range of IP addresses.

**permit**

permit user { all | name }
permit system { all | name }
permit ip { all | ipaddr[-ipaddr] }

With this command the local license server permits access to the local license server for a user, a system, an IP address or a range of IP addresses.
**block**

block user { all | name } to key  
block system { all | name } to key  
block ip { all | ipaddr[-ipaddr] } to key

With this command the local license server blocks access to a specific license for a user, a system, an IP address or a range of IP addresses.

**bind**

bind user { all | name } to key  
bind system { all | name } to key  
bind ip { all | ipaddr[-ipaddr] } to key

With this command the local license server allows access to a one specific license for a user, a system, an IP address or a range of IP addresses. A subsequent bind command can overrule a previous bind command.

**borrow deny**

borrow deny user { all | name } from { all | key }  
borrow deny system { all | name } from { all | key }  
borrow deny ip { all | ipaddr[-ipaddr] } from { all | key }

With this command the local license server denies a user, a system, an IP address or a range of IP addresses to borrow any license or a specific license.

**borrow permit**

borrow permit user { all | name } from { all | key } days n  
borrow permit system { all | name } from { all | key } days n  
borrow permit ip { all | ipaddr[-ipaddr] } from { all | key } days n

With this command the local license server permits a user, a system, an IP address or a range of IP addresses to borrow any license or a specific license for a maximum number of days.

**Examples**

To allow access to user eric only, enter:

deny user all  
permit user eric

To specify that system svr100a is not allowed to access license key aaaa-bbbb-cccc-dddd, enter:

block system svr100a to aaaa-bbbb-cccc-dddd
To specify that all users are bound to license key xxxx-xxxx-yyyy-yyyy, except for users hans and martin and that they are bound to license key 1234-5678-9012-3456 and aaaa-bbbb-cccc-dddd respectively, enter:

```
bind user all to xxxx-xxxx-yyyy-yyyy
bind user hans to 1234-5678-9012-3456
bind user martin to aaaa-bbbb-cccc-dddd
```

To bind all users to the (product code) license 3de8-76aa-ed65-3271, except for two development departments:

```
bind ip all to 3de8-76aa-ed65-3271
bind ip 192.168.1.0-192.168.1.100 to 6a3c-cc42-1b40-a4ec
bind ip 192.168.1.101-192.168.1.200 to 11fa-5eca-7fee-1cd8
```

To allow an IP address range to borrow a license from 6a3c-cc42-1b40-a4ec for a maximum of three days, enter:

```
borrow deny ip all from all
borrow permit ip 192.168.1.0-192.168.1.100 from 6a3c-cc42-1b40-a4ec days 3
```
